Monday 8th June

It is the year 2089 and here is Rex Plover, the world's most famous animal explorer, discovering the most advanced and mysterious creatures on planet Earth. Creatures and animals have developed over the years, adapting to constant change of surroundings and climate.

Here is a new creature I managed to photograph on my travels to Africa last year. It is the extremely rare Rhiswanozebtah. It is believed to contain DNA from four different animals: rhinos, swans, zebras and cheetahs – which gives it its name.

Now you know it's a mix of
rhino plus
swan plus the
o of rhino plus the start of
zebra and the end of
cheetah,
you will be able to pronounce it easily!

Task - You have joined Rex on one of his exploratory expeditions in Africa and have discovered a new creature/animal!

The creature/animal has a mixture of DNA giving it a distinct appearance, diet, habitat and way of life!

What is the name of this creature/animal?

What makes it so threatening? Incredible?

Think carefully and creatively as this will help your writing later in the week

Use your ideas to write an acrostic OR narrative poem that uses descriptive language to explain/describe what it is like (remember to think about appearance; diet; habitat; characteristics etc.).

If you are struggling to think of an animal, use a mixture of the animals below (which parts will you take from each):
